adhesion kinase. A putative mechanism for the integrin-mediated tyrosine phosphorylation of Crk-associated substrates.";
J. Biol. Chem. 272:29083-29090 (1997).

- FUNCTION: DOCKING PROTEIN WHICH PLAYS A CENTRAL COORDINATING ROLE FOR TYROSINE-KINASE-BASED SIGNALING RELATED TO CELL ADHESION.

- IMPLICATED IN INDUCTION OF CELL MIGRATION (BY SIMILARITY).

- SUBGUNIAT: FORMS COMPLESE IN VIVO WITH FOCAL ADHESION KINASE 1,
ADAPTER PROTEIN CRKL AND LYN KINASE. CAN HETERODIMERIZE WITH CASL.

- SUBCELLUARE LOCATION: FOCAL ADHESIONS AND STRESS FIBERS.

- UNPROSPHORYLATED FORM LOCALIZES IN THE CYTOPLASM AND CAN MOVE TO THE MEMBRANE UPON TYROSINE PHOSPHORYLATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, and nivirial and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                       ô
                      This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.

By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Sequences AAV69610-Y69611 and AAV69617 represent tachyplesin analogues
used in an exemplification of the present invention, in which the
native trachyplesin cysteine residues are replaced with Ala, Leu and
ASP, respectively Tachyplesin (AAV69608) is a naturally occurring
antimicrobial peptide which contains two disulphide bonds which help
committain its tertiary structure. The invention relates to novel
committee residues at positions 3, 7, 12 and 16 of the native
the cysteine residues at positions 3, 7, 12 and 16 of the native
the cysteine replaced by the hydrophobic amino acids isoleucine,
walthe, methionine, phenylalanine or tyrosine, the same amino acid being
present at all four positions. Despite being unable to form
intramolecular disulphide bonds, the analogues are functional as
antimicrobial agents. The tachyplesin analogues are useful for
controlling fungal and viral activity in agricultural and medical
applications and for controlling plant viruses. They can also be
corresponded to the present sequence is not shown in the
specification, but is derived from the generic tachyplesin analogue
                                                                                                                                                                                                                     New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;

The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium praninearum, Fusarium moniforme, Sclerothinia sclerotiorum, Sclerothinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

  of the above positions"
                                                                                                                                  AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

This sequence represents a generic tachyplesin (TP) analogue which has antimicrobial activity. Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAY69614, AAY69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the mative the cysteine are replaced by the hydrophobic amino acids isoleucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form antimicrobial agents. The tachyplesin analogues are functional as intramalecular disulphide bonds, the analogues are useful for controlling fungal and viral activity in agricultural and medalcal capturations and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, sorge or especially maize plants to provide resistance to pathogenic fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                           New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              analogue; generic; antimicrobial; disulphide bond; antiviral; antimicrobial; transgenic plant.

                                                                                                                                                                                                                                                                                                                 á
                                                                                                                     Sequences AAV69610-Y69611 and AAV69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala. Leu and Asp. respectively. Tachyplesin (AAV69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAV69614, AAV69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isoleucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are functional as antimicrobial agents are tachyplesin analogues are functional as antimicrobial agents. The tachyplesin analogues are functional as applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic funging and viruses. Note: The present sequence is not shown in the controlling the present sequence is not shown in the controlling the present sequence is not shown in the controlling the present sequence is not shown in the controlling the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75605) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium monificame, Sclerctinia sclerotiorum, Sclerctinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR7805) a small peptide isolated from japanese horseshoe crab haemcoytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and animals.
                                                                                                                                                                                                                                                                                                      New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;

The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monliforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

                                                                                                                                                                                                                                ó;
                                                                   AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerctinia sclerctiorum, Sclerctinia trificiorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

The lipopolysaccharide-binding polypeptides may be prepd. by either solid-phase peptide synthesis followed by oxidn. to form the disulphide bridges or, subjecting horseshoe crab haemocytes to hypotonic extraction, extracting the residue with acid, and purifying the extract. The polypeptides have high affinity for lipopolysaccharide (LPS) endotoxins and are useful for removing such toxins from fluids, as antibacterial agents, eg active against Salmonella spp. and S. aureus, and for tracheolysaccharing LPS-mediated immune and inflammatory disorders, eg superior tracheolorochial infections, urhary tract infections, bedsores, burns, complications.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Sequence 9, Application US/08168809
Patent No. 5580852
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Putnam, Rebecca J.
APPLICANT: Rao, Aragula G.
TITLE OF INVENTION: DERIVATIVES OF TACHYPLESIN HAVING
TITLE OF INVENTION: DIRIBITORY ACTIVITY TOWARDS PLANT PATHOGENIC FUNGINUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSES: Pioneer Hi-Bred International
STREET: 700 Capital Square, 400 Locust Stree
CITY: Des Moines
Sequence 15, Application US/08168809

A; Accession: B33287
A; Status: nucleic acid sequence not shown; not compared with conceptual translation
A; Molecule Type: DNA
A; Residues: 53-88 'S', 90-109 <SC2>
A; Experimental source: allele designated DQB 1.2
A; Accession: F33287
A; Experimental source: allele designated DQB 1.3
A; Molecule type: DNA
A; Residues: 53-88 'D', 90-109 <SC3>
A; Experimental source: allele designated DQB 1.3
A; Molecule type: DNA
A; Residues: 53-88 'D', 90-109 <SC3>
A; Experimental source: allele designated DQB 1.3
A; Note: this allele appears to confer susceptibility to pemphigus vulgaris
A; Note: this allele appears to confer susceptibility to pemphigus vulgaris
A; Note: this allele appears to soffer susceptibility to pemphigus vulgaris
A; Note: this allele appears to soffer susceptibility to pemphigus vulgaris
A; Note: this allele appears to soffer susceptibility to pemphigus vulgaris
A; Note: this allele designated DQB 1.3

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Complete genomic organization of the human JAK3 gene and mutation analysis in severe combined immunodeficiency by single-strand conformation polymorphism."

Hum. Genet. 106:73-79(2000).

Hum. Genet. 106:73-79(2000).

THE INTERLEDITION: TYROSINE KINASE OF THE NON-RECEPTOR TYPE, INVOLVED IN THE INTERLEDITION: TYROSINE KINASE OF THE NON-RECEPTOR TYPE, INVOLVED IN THE INTERLEDITION: TYROSINE APPARATE, IRS1, IRS2 AND PI3K.

-I. CARALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.

-I. SUBGELLULAR LOCATION: WHOLLY INTRACELLULAR, POSSIBLY MEMBRANE ASSOCIATED (BY SIMILARITY).

ASSOCIATED (BY SIMILARITY).

                                                                                                                                                                                                                                                                                        DOMAIN: POSSESSES TWO PHOSPHOTRANSFERASE DOMAINS. THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
DIFFERENT MRNA SOURCES: BREAST (JAK3B), SPLEEN (JAK3S; SHOWN HERE), AND ACTIVATED MONOCYTES (JAK3M). JAK3B MAY BE DEFECTIVE AS IT LACK SOME PART OF THE KINASE DOMAIN.
TISSUE SPECIFICITY: IN NK CELLS AND AN NK-LIKE CELL LINE BUT NOT IN RESTING T CELLS OR IN OTHER TISSUES. THE S-FORM IS MORE COMMONLY SEEN IN HEMATOPOIETIC LINES, WHEREAS THE B- AND M-FORMS ARE DETECTED IN CELLS BOTH OF HEMATOPOIETIC AND EPITHELIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 OF
                                                                                                                                                                                                                                                                                                                                                                                                                                 PTM: TYPE PHOSPHORYLATED IN RESPONSE TO IL-2 AND IL-4. DISBASE: DEFECTS IN JAK3 ARE A CAUSE OF RECESSIVE T-CELL DISBASE: DEFECTS IN JAK3 ARE A CAUSE OF RECESSIVE T-CELL POSTITUE SEVERE COMBINED IMMUNODEFICIENCY (T-B+SCID). A CONDITION CHARACTERIZED BY THE ABSENCE OF CIRCULATING MATURE T-IXMPHOCYTES AND NK CELLS, NORMAL TO ELEVATED NUMBERS OF NONFUNCTIONAL B-LYMPHOCYTES, AND MARKED HYPOPLASIA OF LYMPHOID
